

Jeep Grand Cherokee Steer-By-Wire

Steering by-wire in the Jeep Grand Cherokee

Features

- Computer control of steering
- Measure steering wheel position
- Driver override by grabbing the steering wheel
- CAN and USB interfaces
- No modifications to vehicle
- Signal passthrough on power off

Applications

- Driverless car research
- Advanced Driver Assist (ADAS) research

Description

The Dataspeed Inc. Steer-By-Wire interface enables computer control of the steering wheel in a safe and effective manner. This plug-in ready kit requires no modification to the factory harnessing and can be installed in minutes. Industry standard CAN and USB networks enable control and monitoring of the steering system.

1 Connector Pin Description

1.1 CAN/DB9 Connector

The CAN/DB9 connector is used for power and CAN communication. Short pins 1 and 6 together to activate the digital input.

Table 1: CAN/DB9 connector pin description.

Pin	Symbol	Description
1	DIGIN	Digital Input
2	CANL	CAN Low
3	GND	Ground
4	IGNITION	Ignition (12V)
5	NC	No Connect
6	GND	Ground
7	CANH	CAN High
8	NC	No Connect
9	POWER	Power (12V)

1.2 USB Connector

The USB connector is used for introspection and firmware upgrade.

The conversion factor was experimentally determined to be 125.5 counts per revolution. It is recommended to experimentally calculate the conversion factor for a particular vehicle by comparing wheel position counts over time with wheel speeds.

5 Function

- **Modifying the Steering Signals:** The by-wire interface modifies the steering signals when power is applied and the required CAN messages are received. The vehicle steering system will function regardless of the CAN messaging and applied power to the by-wire interface.
- **Power-off State:** Without power applied, the hardware passes signals through unaltered.
- **Disabled State:** In the disabled state, steering signals are not modified. This corresponds to $EN = 0$. The by-wire interface does not respond to any SCMD until the enable bit (EN) is set to 1.
- **Power-up State:** The by-wire interface powers up in the disabled state. $EN = 0$.
- **Watchdog Timer:** If the by-wire interface does not receive a steering command message within 100ms, the by-wire interface enters the disabled state.
- **Driver Override (Steering):** If the system senses torque on the steering wheel from the driver, control is given to the driver by entering the driver override state. This corresponds to $OVERRIDE = 1$ and $EN = 0$ in the CAN steering report message. This can be cleared by toggling EN from 0 to 1, or by setting CLEAR to 1 in the CAN steering command message.
- **Audible Warning:** The steering module simultaneously activates the front and rear parking proximity warning chimes for one second to indicate an unintentional transition from computer control back to manual control. This is defined as a transition of the EN bit from 1 to 0 in any of the report messages for brake/throttle/steering/shifting, without a corresponding transition in the command message. An unintentional transition could be caused by an override, timeout, fault, or any other unexpected behavior. The brake and throttle report messages are received on the CAN bus from the external throttle/brake module.

6 Supported Vehicles

The Steering By-Wire interface has been tested on the Jeep Grand Cherokee for model years 2018 and 2019. The "Parallel and Perpendicular Park Assist" package is required for steering.

7 Watchdog Counter

The watchdog counter is an optional feature enabled by incrementing the COUNT bits to assist in compliance with California autonomous vehicle requirements. This is separate from the 100ms watchdog timeout always present for each command message. Each module monitors its own state and the state of all other modules for error conditions. To clear a watchdog counter event, press the OK button on the left side of the steering wheel or cycle power to all modules.

7.1 Fault Conditions

- Count is not incremented, or count is incremented more than 3 (this allows up to 2 dropped messages)
- Command timeout after 100ms (catches main computer crash, power loss, or disconnect)
- Report timeout after 100ms (catches failure of embedded firmware)
- Transition from enabled to disabled (catches unexpected transfer of control to the driver)
 - This fault condition can be disabled with the DbwConfig GUI.
- Vehicle must be out of park or moving for any of these conditions to set off an alert

7.2 Fault Actions

- Normal driver override audible and visual alert for one second (sets off the front park aid warning)
- Apply small amount of braking until the driver takes control with the brake pedal, throttle pedal, but not the steering wheel. The applied braking value is 0.25, which corresponds to 925 Nm of braking torque. The braking value can be changed with the DbwConfig GUI.
- Flash the passenger airbag ON and OFF lights until the alert is cleared to show that the watchdog is faulted
- All commands to all subsystems are ignored until the alert is cleared
- Steering will continue to respond to commands if the fault is caused by the brake or throttle

APPENDIX A: REVISION HISTORY

Revision A-01 (October 2018)

Modifications:

1. Initial release of this document.

Revision A-02 (November 2018)

Modifications:

1. Added ULC messages.
2. Added notes about parameters (overrides and watchdog counter).
3. Added mechanical drawing.
4. Updated product photo.
